

Name : Yash Patil

PRN : 202501080011

Batch : IT1(l11).

Practice LabAssignment: 2

1. Perform all List Operation,DictionaryOperations.

Code :

```
student["PRN"] = 202501080011
print("After adding PRN:", student)
After adding PRN: {'Name': 'Yash Patil', 'Age': 18, 'Grades': [85, 90, 98], 'PRN': 202501080011}
student["Age"]=19
print("After updating age:", student)
After updating age: {'Name': 'Yash Patil', 'Age': 19, 'Grades': [85, 90, 98], 'PRN': 202501080011}
student.pop("Grades")
[85, 90, 98]
print("After removing grades:", student)
After removing grades: {'Name': 'Yash Patil', 'Age': 19, 'PRN': 202501080011}
keys=student.keys()
print("Keys:", keys)
Keys: dict_keys(['Name', 'Age', 'PRN'])
values=student.values
print("Values:", values) Values: dict_values(['Yash Patil', 19, 202501080011])
student_copy=student.copy()
print("copy of dictionary:", student_copy)
```

Lab Assignment: 2

1. Select the number from the entered list and find its position in Python (use Linear Search). Code

:

main.py	Output
<pre>1 lst = [] 2 n = int(input("Enter number of elements: ")) 3 for i in range(n): 4 lst.append(int(input("Enter number: "))) 5 x = int(input("Enter number to search: ")) 6 for i in range(n): 7 if lst[i] == x: 8 print("Position:", i+1) 9 break 10 else: 11 print("Number not found") 12 13</pre>	<pre>Enter number of elements: 6 Enter number: 456 Enter number: 788 Enter number: 658 Enter number: 699 Enter number: 456 Enter number: 789 Enter number to search: 788 Position: 2 === Code Execution Successful ===</pre>

2. Choose cricket team of eleven players find the captain of the team (consider tallest person as a captain) using dictionary.

Code :

```
main.py
1 team = {}
2
3 for i in range(11):
4     name = input("Enter name: ")
5     height = int(input("Enter height: "))
6     team[name] = height
7
8 captain = max(team, key=team.get)
9
10 print("Captain is:", captain)
11 print("Height is:", team[captain])
12
13
```

Output

```
Enter name: rohit
Enter height: 654
Enter name: sahil
Enter height: 689
Enter name: amit
Enter height: 452
Enter name: karan
Enter height: 656
Enter name: arjun
Enter height: 635
Enter name: yash
Enter height: 532
Enter name: rahul
Enter height: 263
Enter name: virat
Enter height: 523
Enter name: ansh
Enter height: 565
Enter name: parth
Enter height: 598
Enter name: sameer
Enter height: 555
Captain is: sahil
Height is: 689
=== Code Execution Successful ===
```

Self Study Assignment: 2

1. Consider the student subjects marks are stored in the list. Find the total marks and percentage of students.

Code :

```
main.py
1 marks = []
2 n = int(input("Enter number of subjects: "))
3 for i in range(n):
4     m = int(input("Enter marks: "))
5     marks.append(m)
6 total = sum(marks)
7 percentage = total / n
8 print("Total Marks:", total)
9 print("Percentage:", percentage, "%")
10
11
12
13
14
15
```

Output

```
Enter number of subjects: 3
Enter marks: 78
Enter marks: 98
Enter marks: 68
Total Marks: 244
Percentage: 81.33333333333333 %
=== Code Execution Successful ===
```

2. Perform all tuple operations.

Code :

```
IDLE Shell 3.14.3
File Edit Shell Debug Options Window Help
Python 3.14.3 (tags/v3.14.3:323c59a, Feb  3 2026, 16:04:56) [MSC v.1944 64 bit (AMD64)] on win32
Enter "help" below or click "Help" above for more information.
>>> t = (10, 20, 30, 40, 50)
>>> print("Tuple:", t)
Tuple: (10, 20, 30, 40, 50)
>>> print("Length:", len(t))
Length: 5
>>> print("First element:", t[0])
First element: 10
>>> print("slice:", t[1:4])
slice: (20, 30, 40)
>>> print("Count of 20:", t.count(20))
Count of 20: 1
>>> print("index of 30:", t.index(30))
index of 30: 2
>>> t2 = (60, 70)
>>> print("After adding:", t+t2)
After adding: (10, 20, 30, 40, 50, 60, 70)
```
